Plaisir
Investor forecast

One Manhattan flagship | 36 trading months | USD | Issued 27 October 2026

Pre-opening management planning forecast. Years begin at the first trading month, not a fixed calendar date. No historical Plaisir trading results are represented. This forecast replaces the earlier $833,000 sales / $62,000 EBITDA illustration and the subsequent $95,000 EBITDA example.

Investment conclusion

The full service and employee-benefit concept requires approximately $1.10 million of initial equity under the central assumptions. It funds opening and maintains a three-month fixed-cost cash reserve over the 36-month base case. However, the store remains slightly EBITDA-negative once established. Funding covers the forecast period; it does not fix the commercial shortfall.

Base case	Year 1	Year 2	Year 3
Net sales	$1,003,995	$1,234,764	$1,271,807
Gross profit	$698,726	$859,329	$885,109
Total payroll	$550,231	$570,165	$589,276
Occupancy	$144,000	$148,320	$152,770
Other fixed operating costs	$72,000	$74,160	$76,385
Payment / marketing / consumables	$65,374	$80,138	$82,280
EBITDA	$-132,879	$-13,454	$-15,602
Net income after planning tax	$-196,175	$-79,097	$-83,751
Free cash flow	$-143,088	$-26,407	$-28,943
Year-end unrestricted cash	$278,912	$252,505	$223,562

Gross margin: 69.6% throughout. EBITDA margins: -13.2%, -1.1%, -1.2%. Sales growth after the opening ramp comes only from 3% annual pricing; paid visits do not keep increasing. Wage and health inflation gradually outpace the price uplift.

What the forecast supports

Present this as a disciplined single-site underwriting case with an explicit route to profitability. Do not describe the unchanged plan as already profitable, promise investor returns, or finance a second store from this base case. A 10% EBITDA hurdle is a chosen investment target, not an industry guarantee.

The Excel model contains a live Base / Downside / Upside selector, editable annual drivers, 36 monthly profit-and-loss, cash-flow and balance-sheet calculations, opening uses and funding, and profitability thresholds. This PDF shows the issued scenarios; it updates only when reissued from the model.

1. Revenue and operating plan

Established daypart	Paid visits/day	Net spend/visit	Opening-price sales/year
Coffee / breakfast	100	$9.00	$324,000
Lunch / daytime food	35	$18.00	$226,800
Afternoon / evening wine + food	45	$40.00	$648,000
Total / weighted average	180	$18.50	$1,198,800

Net sales = paid visits x realised pre-tax spend x 360 trading days. The customer-spend hypotheses sit inside the supplied target-customer ranges [1]. Afternoon activity is included in the wine/food block; it is not a fourth revenue stream. A paid visit is a purchase occasion, not a unique person. No catering, private-event, membership, retail-wine, franchise or expansion income is needed to reach these sales.

Opening ramp and inflation

Monthly sales volumes reach 50%, 60%, 70%, 75%, 80%, 85%, 90%, 95%, 100%, 100%, 100%, 100% of established trade. That produces 54,270 paid visits and $1,003,995 sales in Year 1. Years 2 and 3 each hold 64,800 visits; the weighted net bill rises to $19.06 and $19.63. The model uses 30 trading days per month and neutral calendar seasonality until an opening date is fixed.

Annual price increases are 3%; product-purchase inflation is also 3%. Opening product-cost ratios are 28% breakfast, 35% lunch and 30% evening. Cost of goods sold is calculated from visits, opening menu prices and purchase inflation, independently of selling-price inflation. These recipe and waste allowances require menu cost sheets; they are not measured supplier margins.

Capacity and staffing brief

The working format is about 1,000 ground-floor sq ft in existing hospitality premises, a simple bought-in/assembly-led menu and a 40-seat design target. Legal seating and usable area are not confirmed. Customer hours follow the proposed 07:00-23:00 span with prep and close outside it. Daypart cover totals 41 staff-hours/day including manager floor time. The GM provides 1,560 floor hours and 520 administration hours annually; 13,200 hours remain for hourly employees.

The annual coverage budget is a staffing-cost framework, not a signed weekly rota. Shifts must cover breaks and leave while avoiding unbudgeted overtime. No unpaid founder labour is assumed. Central-office salaries, external fundraising costs and a second management team are excluded; add these if the company incurs them.

Demand interpretation

The 180 daily visits are a management assumption; documents and public market evidence do not demonstrate address-specific demand. No unsupported promotional uplift is used. Before lease commitment, test the required daypart volumes through relevant footfall and competitor counts, pop-up transactions and actual realised checks. The forecast is a complete numerical plan, with demand confidence clearly distinguished from calculation accuracy.

2. Payroll, rent and running costs

Opening-year payroll calculation	USD
Scheduled hourly wages	$297,000
General manager	$95,000
Leave cover + training	$25,660
Employer FICA on wages	$31,951
UI / workers-comp allowance	$12,530
Health: 8 enrolled x $7,885	$63,080
Dental / vision: 8 x $600	$4,800
Retirement + incentive provisions	$12,530
Core annual payroll	$542,551
Employer FICA on tips, Year 1	$7,681
Total payroll, Year 1	$550,231

The $22.50 hourly cash-wage assumption is within ELOREA's published NYC barista range of $20-25 [2]. It is a blended hiring allowance; role-specific pay may differ. The $95,000 manager allowance is selected, not an accepted offer. Hourly leave cover is 6%, paid training 2% of scheduled wages, employer FICA 7.65%, UI/workers-comp 3%, retirement 2% and incentive 1% of gross payroll. No tip credit or FICA tip-tax credit is assumed [4].

KFF 2025 single coverage: $9,325 premium less $1,440 worker contribution = $7,885 employer cost [3]. This is a national research anchor, not an NYC small-group quote. Eight enrolled staff, $600 dental/vision each and 6% annual health inflation are assumptions. Other cash wages rise 3% annually. Family cover is excluded; adopting it requires a higher budget.

Premises and other costs

Selected first-year rent is $120,000 plus $24,000 additional occupancy charges, or $12,000/month total. Centennial's sheet dated 24 September 2026 lists the equipped west restaurant at 219 East 23rd Street around 1,000 sq ft at $9,995/month [5]. This supports a rent target, not availability or agreed use. The prior $72,000 base rent and unexplained $216,000 occupancy are replaced with this explicit bridge.

Other annual fixed expenses: utilities $18,000; insurance $12,000; software $6,000; accounting/legal $6,000; repairs $9,000; waste/pest/laundry $12,000; music/permits $3,000; miscellaneous $6,000. Total $72,000. Occupancy and these costs escalate 3% annually. Each is an allowance pending terms or quotes; utilities and insurance are counted here once.

Card fees: 90% card share x [2.6% of sales including assumed 8.875% sales tax and 10% tips + $0.15 per paid visit], using a published Square plan [7-8]. Marketing is 2% of net sales; consumables 1%. Discounts are already reflected in realised spend. Employee tips are not revenue; employer FICA on tips remains an operating cost.

3. Opening capital and cash

Opening use / source	USD
Building works / service adaptation	$200,000
Fixed bar / joinery	$40,000
Equipment / POS / smallwares	$90,000
Loose furniture / fittings	$35,000
Tax / freight allowance	$15,000
Specialist commissioning	$20,000
Works / equipment / furniture subtotal	$400,000
20% contingency, treated as spent	$80,000
Professional / legal / permits / licensing	$50,000
Pre-opening payroll	$40,000
Launch marketing	$10,000
Four months pre-opening occupancy	$48,000
Refundable deposits	$30,000
Opening inventory	$20,000
Total pre-opening cash use	$678,000
Initial equity funding	$1,100,000
Cash at first trading day	$422,000

Works, furniture and equipment total $400,000 before contingency, or $400/sq ft at the 1,000-sq-ft target. A contractor guide gives $300-450/sq ft for full-service second-generation restaurant work [6]. Boundaries differ between guides and bids; do not add a second equipment budget on top of this combined allowance. Major structural works, new exhaust routes and acquisition/key-money premiums are excluded. A cold-shell conversion needs a separate budget.

Opening sources and uses are fully funded before trading. Capitalised assets are $480,000; pre-opening expenses $148,000; deposits $30,000; inventory $20,000. Inventory is expensed when consumed; deposits are assets. Contingency is included as spent, not also held as a second cash reserve. Four months is a budget duration, not a guaranteed permitting/construction programme.

Funding calculation

Base cumulative free-cash outflow over 36 months is $198,438. The ending policy reserve is $202,175. Minimum funding = opening uses + maximum cumulative cash deficit plus the applicable monthly policy reserve: $1,078,614. Selected equity of $1,100,000 leaves $21,386 above that requirement. This is a liquidity calculation, not a valuation.

Working capital uses 21 days of product costs with a $20,000 opening-price minimum stock, seven days supplier credit and two days card settlement. Maintenance capex is 1% of sales. Sales tax and tips are ringfenced/remitted and excluded from usable cash; no benefit is taken from retaining those balances. Debt, interest, dividends and investor redemption are zero.

4. Downside, upside and investment hurdles

Issued scenario	Year 1 sales / EBITDA	Year 2 sales / EBITDA	Year 3 sales / EBITDA
Downside	$803,196 / $-258,013	$987,811 / $-167,403	$1,017,446 / $-174,222
Base	$1,003,995 / $-132,879	$1,234,764 / $-13,454	$1,271,807 / $-15,602
Upside	$1,204,794 / $-27,629	$1,481,717 / $120,014	$1,526,168 / $121,923

Liquidity at $1.10m initial funding	Downside	Base	Upside
Year 3 closing cash	$-302,013	$223,562	$550,991
Funding needed for cash policy	$1,604,188	$1,078,614	$953,664

Downside: 20% fewer visits in every month and 20% higher initial capital spend, on top of the already-contingent $480,000 base capex; additional opening use is $96,000. No automatic staffing reduction masks the sales risk. At $1.10m funding the three-month reserve is breached in Month 5 and cash becomes negative in Month 17. Negative cash represents an unfunded shortfall, not permitted borrowing. About $1.61m would fund this stress through Month 36 while preserving policy.

Upside: 20% more visits (216/day when established), with two extra paid staff-hours/day and the same employer-cost formula. No expansion revenue is included. Year 2 EBITDA is about $120,000, an 8.1% margin. This is a sensitivity to demand, not a forecast probability or a commitment to the extra traffic.

Commercial thresholds to present to investors

Year 2 operating threshold	Calculated requirement
EBITDA break-even, current base staffing	$1,256,347 sales/year; 183.1 visits/day
10% EBITDA, current base staffing	$1,496,385 sales/year; 218.1 visits/day
10% EBITDA, including upside extra cover	$1,535,515 sales/year; 223.8 visits/day
Alternative: cost reduction at base sales	$136,931/year to reach 10% EBITDA

Required sales = fixed costs / (contribution margin - target EBITDA margin). Break-even sets the target to zero. Visit thresholds hold the forecast daypart mix and bill constant; extra peak labour, kitchen demands or capacity limits can raise the requirement further. A $136,931 annual cost reduction at base sales is a large operating redesign, not an available saving. Do not combine a cost saving and revenue gain without showing their delivery assumptions.

Investment position: retain the central case as disclosed. Make lease commitment conditional on a costed rota/menu and site evidence that supports a viable margin. The upside gives an investable direction to test; the base case does not support promised distributions, payback or an expansion timetable.

5. Calculation basis and evidence

Accounting and forecast conventions

EBITDA = net sales - product costs - total employer payroll - occupancy - other operating costs. EBIT subtracts book depreciation; net income subtracts the planning tax provision. Depreciation uses 70% of initial capex over 120 months and 30% over 60 months, zero residual; maintenance is depreciated over 60 months with a half-month on additions. These are book assumptions, not tax elections or a depreciation study.

Tax is conservatively budgeted at 30% of each positive monthly EBIT, with no relief for earlier losses, tax credits or deferred tax assets. It is not an assertion of the effective rate for a yet-unselected entity. The base has no positive EBIT months. Replace the provision with entity-specific federal, state and city treatment when the structure is agreed. Operating cash = net income + depreciation - increase in operating working capital; free cash flow then deducts maintenance capex.

The three-month reserve is three times each month's core payroll, occupancy and other fixed operating cost. It is a policy choice, not three months of total sales or a guaranteed runway. The workbook calculates funding from the lowest cash-minus-policy point across all 36 months. Balance sheets reconcile monthly in all three scenarios; scenario and demand-input changes were recalculated and checked for spreadsheet errors.

Sources reviewed 27 October 2026. Published asking rents, job advertisements and vendor cost guides are comparison evidence, not executed terms. The main remaining evidence is address-level demand, a lease cost schedule, measured layout and service condition, comparable contractor bids, recipe/supplier costs, and payroll/benefit quotes. These are named input uncertainties; the arithmetic and monthly forecast are complete.

Investor presentation

Use the central sales / EBITDA / cash table, itemised uses, selected $1.10m raise, 36-month liquidity need and both sensitivities. Include this assumption basis with the numbers. Report actual paid visits, realised bill, gross margin, scheduled labour and cash against forecast monthly after opening; revise the forecast when evidence changes.
